

## Application

The central vacuum cleaner – PYTON-1 facilitates to keep clean and hygienic conditions in the dwelling house, flat and garage. The main advantages of the central vacuum cleaner are:

- **Hygiene** – dust and pollutants are sucked in and forwarded to the central unit, where they are captured in a filter and the air with smallest dust fractions (e.g., mites) is removed outdoors.
- **Usefulness** – user manoeuvres the light weighed hose. There is no need to control and exchange the dust bag so often as in case of portable vacuum cleaner.
- **Comfort** – the central vacuum cleaner does not cause noise as the traditional vacuum cleaner – because it is located in spare room or in a garage.

## Structure

The device consists of:

- steel housing with connections: inlet and outlet,
- two-layer filter bag – serving as a waste bag,
- high-pressure turbine.

The polluted air is sucked into the pipe system, is forwarded through the filter bag, where are accumulating the impurities. The cleaned air is removed out of accommodation. The waste bag ought to be emptied periodically (every 2 – 4 months).

## Technical data

Type	Part No.	Flow efficiency [m <sup>3</sup> /h]	Underpressure [Pa]	Volume of the waste bag [dm <sup>3</sup> ]	Turbine motor		Weight [kg]	Surface of cleaning [m <sup>2</sup> ]	Max. distance from suction socket [m]	Length of suction hose [m]
					Motor rate [kW]	Supply voltage [V]				
PYTON-1-N	857024	276	32000	25	1,6	230	9	Up to 400	40	9
